Abstract: A facile microwave assisted one-pot synthesis of novel 1-phenylethylhexahydroquinazolin-5(6H)-ones 3a-j and bis-1-phenylethylhexahydroquinazolin-5(6H)-ones 4a-f & 5a-d has been devised by the cyclocondensation of cyclic enaminones 2a-b with primary amines/diamines and formaldehyde. The structures of the products have been established with the help of spectral and analytical data.

Keywords: 1-Phenylethylhexahydroquinazolin-5(6H)-ones; bis-1-phenylethylhexahydroquinazolin-5(6H)-ones; enaminones; diamines; cyclocondensation.

1. Introduction: Quinazolines have attracted considerable attention because of their great pharmacological importance and biological activities. Keeping in view the biological properties of octahydroquinazolines [1-3], we have recently reported [4-6] the synthesis of hexahydroquinazolin-5(6H)-ones bearing phenyl, benzyl and methyl groups in position 1 of the ring and bis-hexahydroquinazolin-5(6H)-ones bearing phenyl, benzyl and methyl group

in position 1 of the ring. The biological properties of these molecules are under investigation. We now wish to report herein a short MW assisted synthesis of hexahydroquinazolin-5(6H)-ones and bis-hexahydroquinazolin-5(6H)-ones bearing phenylethyl group in position 1 of quinazoline ring to see the impact this group incorporated in position 1 on biological properties of these molecules.

2. Methods

Melting points were recorded by open capillary method and are uncorrected. The IR spectra were recorded on a Perkin-Elmer 983 spectrometer. $^1$H NMR (300 MHz) spectra were recorded on Bruker ACF-300 spectrometer. The chemical shifts (δ ppm) and the coupling constants (Hz) are reported in the standard pattern with reference to TMS as internal reference. FAB-mass spectra (MS) were measured on JEOL 3SX 102/DA-6000 Mass spectrometer using Argon as the FAB gas and m-nitrobenzylalcohol as the matrix. Elemental analyses were performed on a Vario-EL III instrument. Microwave irradiation was carried out in CEM Discover Benchmate microwave digester. Enaminones 2a and 2b were synthesized by reported procedure [7].

Synthesis of 1,3-substituted-1,2,3,4,7,8-hexahydroquinazoline-5(6H)-ones (3a-e) and 1,3-substituted-7,7-dimethyl-1,2,3,4,7,8-hexahydroquinazoline-5(6H)-ones (3f-j). General procedure. A mixture of primary amine (1 mmol) and formaldehyde (2 mmol, 40% aqueous solution) in 1 mL of methanol was stirred for 5 minutes and to this was added a solution of enaminone 2 (1 mmol) in 4 mL methanol in one portion. The resulting reaction mixture was irradiated in a microwave digester for 2-4 minutes at 180 watt at 60°C. At the end of the reaction (tlc), methanol was distilled off under reduced pressure to give a gum which was purified by using chromatographic column (silica gel, EtOAc) to isolate 3a-j in 55-85 % yields.

**Synthesis of bis-Quinazolines 4a-f & 5a-d. General Procedure**

A mixture of diamine (0.5 mmol) and formaldehyde (2 mmol, 40% aqueous solution) in 1.5 mL methanol was shaken at room temperature for 5 minutes. To this mixture, a solution of enaminoone 2 (1 mmol) in 5 mL methanol was added in one lot and the resulting mixture was irradiated in a microwave digester for 2-4 minutes at 180 watt at 60$^\circ$C. At the end of the reaction (monitored by tlc), methanol was distilled off under reduced pressure to give a gum
which was purified by using chromatographic column (silica gel, EtOAc) yielding 4a-f & 5a-d in 51-79% yields.

3. Results and Discussion

Thus, when 3-phenylethylaminocyclohexenone 2a was treated with a mixture methyamine and formaldehyde (1:2) under the influence of microwaves, a product was obtained in 78% yields which was characterized as 1-phenylethyl-3-methyl-1,2,3,4,7,8-hexahydroquinazolin-5(6H)-one 3a on the basis of analytical and spectral data. The reaction of 2a with other
primary amines and formaldehyde behaved in a similar manner and octahydroquinazolines 3b-e were isolated in 55-78% yields. The infrared spectra of 3a-e showed strong peaks in the region of 1553 to 1615 cm$^{-1}$ due to extensively delocalized double bonds and carbonyl groups. In the $^1$H NMR spectra of 3a-e, the methylene protons at C-2 resonated near 3.85 ppm except in 3b where they appeared in the vicinity of 4.57 ppm but in 3d it appeared near 3.45 ppm. This increment in chemical shift could be attributed to the presence of delocalization of N-3 lone pair of electrons with phenyl ring. Methylene protons at C-2 for 3f-j resonated at higher δ value than the corresponding 3a-e which may be due to presence of electronic donating methyl groups at C-7 in 3f-j. Probably a similar explanation could be extended for the appearance of CH$_2$ protons at C-4 close to 3.43 ppm except in 3b and 3d where they were found to resonate near 4.14 ppm and 2.96 ppm respectively. While CH$_2$ protons at C-7 in 3a-e appeared as multiplets in the range of 1.52-1.83 ppm, those at C-6 and C-8 resonated close to 2.40 and 2.30 ppm respectively. The methylene protons at N-1 gave multiplets close to 2.84-3.36 ppm whereas the adjacent methylene protons gave multiplets close to 2.40-2.69 ppm. The Reactions of 2b with formaldehyde and primary amines were subsequently examined under similar conditions and the expected 1-phenylethyl-3-alkyl/aralkyl/aryl-7,7-dimethyl-1,2,3,4,7,8-hexahydroquinazolin-5(6H)-one 3f-j were isolated in 62-85% yields, whose structures could be established with the help of analytical and spectral data. The infrared spectra of 3f-j showed strong peaks in the region of 1526 to 1623 cm$^{-1}$. The $^1$H NMR spectra of quinazoline rings of 3f-j were found to have a similar pattern as those of 3a-e. However, the six methyl protons at C-7 appeared as sharp singlets around 0.90 ppm and the CH$_2$ protons at C-6 and C-8 resonated in ranges of 1.99-2.17 and 2.10-2.25 ppm respectively. The structures of the molecules were well supported by their $^{13}$CNMR spectra.
Encouraged by the successful synthesis of octahydroquinazolines 3a-j, we then turned our attention to the synthesis of bis-octahydroquinazolines. Thus, when enaminone 2a was reacted with 1,2-diaminoethane and formaldehyde under the influence of microwaves in methanol, a product 4a was isolated in 71\% yield, the structure of which was established to be 3,3’-(Ethane-1,2-diyl)bis(1-phenylethyl-1,2,3,4,7,8-hexahydroquinazolin-5(6H)-one based on analytical and spectral data. The reaction was found to be general with other diamines and with corresponding 2a-b to give the respective product 4b-f in 51-68\% overall yields (Table2). We were thus able to connect two octahydroquinazoline rings through flexible aliphatic chains 4a-f and through aromatic linkers 5a-d. The structures of which could be established with the help of spectral and analytical data. The infrared spectra of 4a-f and 5a-
d showed strong peaks in the range of 1538-1669 cm\(^{-1}\) due to extensive delocalization of the enaminone moiety and carbonyl group. The \(^1\)H NMR spectra of these dimers were found to have the same pattern as in the monomeric octahydroquinazolines except that the signals due to NCH\(_2\) protons of ethylene linkers appeared at 2.61-2.73 ppm while those in propylene resonated in the range of 2.04-2.47 ppm and in butylene appeared in the ranges of 2.14-2.34 ppm. The dimeric structures of 4a-d and 5a-d were further supported by their \(^{13}\)C and mass spectra.

4. Conclusion

The present paper describes an efficient, clean, simple, fast and environment friendly strategy for the synthesis of hitherto unknown octahydroquinazolines and bis-octahydroquinazolines from easily accessible starting materials in good yields with promising biological properties. The methodology reported herein is an example of multi-component reactions (MCRs).
